

Clawdbot Ready

Secure AI Agent Deployment for macOS

Deploy Claude-powered messaging agents on Apple Silicon
with VM isolation, security hardening, and full automation

Organized AI | February 2026

The Problem

- **AI agents need to run 24/7**

Businesses want always-on AI assistants on Telegram, iMessage, Discord

- **Security is complex**

AI agents execute code — one mistake can compromise the host system

- **Setup takes expertise**

SSH hardening, firewalls, process isolation, monitoring — too much for most teams

- **macOS is underserved**

Most deployment tools target Linux/Docker; iMessage requires a real Mac

What Clawdbot Ready Does

VM-Isolated Deployment

- Full macOS VM via Lume hypervisor
- Separate Apple ID support
- Snapshot & rollback capabilities
- Defense-in-depth security
- 8-phase automated setup
- Best for: Production & multi-tenant

Native macOS Deployment

- Zero virtualization overhead
- Full hardware acceleration
- 15-minute setup time
- LaunchAgent auto-start
- Emergency stop kill switch
- Best for: Dev, testing, single-user

Both options: \$0 cost • iMessage support • Apple Silicon native • Fully documented

Security Architecture

Defense-in-depth: 5 layers protecting your system from AI agent risks

Layer 1: VM Isolation

Full OS boundary between agent and host — stronger than containers

Layer 2: Firewall Rules

Localhost-only access; zero attack surface from the internet

Layer 3: SSH Hardening

Ed25519 keys only, no passwords, limited retries

Layer 4: exec-approvals

Deny-by-default command execution — agents can only run approved commands

Layer 5: Monitoring

Continuous health checks, audit logging, anomaly detection

What's in the Toolkit

Setup Automation

- Automated setup.sh scripts
- Phase 0-8 guided install
- Config templates included
- Idempotent (safe to re-run)
- < 30 min deployment

Operations Scripts

- status.sh — health check
- connect.sh — SSH to agent
- monitor.sh — live monitoring
- restart.sh — safe restart
- emergency-stop.sh — kill switch

Documentation

- Customer setup guide
- Deployment architecture
- Team operations playbook
- Troubleshooting guides
- Security hardening docs

CLI Tools (Active Projects)

- Google Ads CLI — campaign management
- Meta Ads CLI — Facebook ad operations
- Clawdbot Sandbox — secure exec SDK
- Gateway log analysis pipeline

25+ Claude Code Skills

- Boris methodology (verification-first)
- Phased build orchestration
- Session management & handoff
- OpenClaw onboarding & deployment

Clawdbot Sandbox SDK

Let AI agents run bash commands safely — without risking the host

3 Sandbox Tiers

InMemory — temp filesystem, no persistence, max isolation
Overlay — copy-on-write layer, reads host, writes isolated
ReadWrite — direct access with path-based guards

Network Security

8 built-in presets:
none, github, anthropic, openai, vercel, stripe, standard, full
URL allowlisting
Per-tier network policies

4 Permission Tiers

VPS — most restricted
Mac Mini — standard
Mac Studio — expanded
Agency — full access

204 tests passing

TypeScript • AI SDK v6 compatible • Plugin system with lifecycle hooks • Ready for npm publish

What's Next: Web Intelligence

Apify integration — giving agents eyes on the web

Phase 0-1	Foundation	Apify CLI + agent-initiated web scraping skills
Phase 2	Cron Pipeline	Scheduled scrapes → local cache → zero-cost morning briefings
Phase 3	Webhooks	External events → isolated agent sessions → real-time alerts
Phase 4	MCP Tools	Direct tool integration with token budget enforcement
Phase 5	Context Budget	Smart context management — auto-fallback to cached data
Phase 6	E2E Testing	All patterns working across Discord, Telegram, WhatsApp

Ready to Deploy

- Secure AI agent deployment on any Apple Silicon Mac
- VM isolation OR native — your choice, both free
- 5-layer security architecture, deny-by-default
- Google Ads + Meta Ads CLI tools for business automation
- Sandboxed execution SDK with 204 passing tests
- 25+ Claude Code skills for development workflows
